VINAY TRADERS

Software User Guide

A practical guide to the dashboard, billing, purchases, inventory, customer accounts, plumber commissions, workers, deposits, settings, notifications, and cloud connection.

Prepared for the Vinay Traders team

Version 1.0 | 29 September 2026

This guide describes the software as it is currently implemented. Screen labels and workflows are written for daily shop operations, so a new staff member can follow the steps without needing the codebase.

Contents

Section	Topic
1	What the software does
2	Opening the software and understanding the first screen
3	Navigation and global controls
4	Daily operating workflow
5	Billing and point of sale
6	Purchases
7	Inventory
8	Customers
9	Plumbers and referral commissions
10	Workers, attendance and payroll
11	Patsanstha deposit ledger
12	Settings and notifications
13	Tables, search, export and mobile view
14	Data, cloud connection and operating safeguards
15	Troubleshooting and quick reference

> The application currently opens directly into the workspace. There is no login screen in the frontend yet; authentication and tenant-scoped security are the remaining production hardening step.

1. What the software does

Vinay Traders is a shop operations workspace for hardware and plumbing supplies. It brings the daily counter, supplier purchases, stock control, customer credit, plumber references, worker payroll, deposit commitments, and business settings into one browser application.

The key idea is that a transaction updates the related records together:

- A completed sale creates an invoice, reduces available stock, records payment or credit, updates the customer balance, and calculates a plumber commission when a reference is selected.
- A completed purchase creates a supplier invoice, increases inventory, records the supplier balance, and writes a stock movement.
- A customer payment reduces the account balance and creates a payment ledger entry.
- A stock adjustment creates a traceable ledger movement instead of silently changing the quantity.
- Attendance feeds payroll calculations; salary payments are recorded against the worker and pay period.
- A deposit entry compares paid money with the expected daily amount and shows paid, partial, skipped, or pending progress.

The application is designed around the role of an administrator who can see all modules. Settings include role names for future permission control, but the current frontend does not yet enforce a sign-in based permission boundary.

Route map

Path	Screen	What it is for
/	Dashboard	Daily overview, metrics, chart, quick actions, recent bills, stock alerts
/billing	Billing	Point of sale, invoice creation, payment, held bills, drafts, history
/purchase	Purchase	Supplier invoices, incoming stock, supplier dues
/inventory	Inventory	Product catalogue, filters, product editor, stock status
/inventory/ledger	Stock ledger	Every purchase, sale, return, adjustment, and balance
/inventory/price-matrix	Price matrix	Bulk selling or purchase rate updates
/customers	Customers	Directory, filters, customer accounts, credit ledger, payments
/plumbers	Plumbers	Partner directory, referrals, commission ledger, payouts
/workers	Workers	Team directory, worker review, payroll entry point
/attendance	Attendance	Daily attendance buttons and date selection
/attendance/monthly	Monthly attendance	Month matrix and bulk present marking
/workers/payroll	Payroll	Monthly salary register and mark-paid actions
/patsanstha	Deposit ledger	Expected, paid, pending, missed days, new deposits
/settings	Settings	Business, GST, inventory, commission, deposits, workers, roles
/notifications	Notifications	Stock, credit, payment, and operational reminders

2. Opening the software and understanding the first screen

Open the production URL or run the project locally. The first screen is the Dashboard. It is a read-only operating summary: use it to decide what to do next, then open the relevant module to make changes.

Dashboard header

Area	Meaning and use
Good morning, Vinay	Workspace greeting and current operating context.
As of	Shows the current date used for the dashboard snapshot.
Today's sales	Completed invoices for today, totalled in INR.
Today's purchase	Today's supplier invoice total and invoice count.
Gross profit	Estimated dashboard margin based on today's sales and purchase activity.
Bills generated	Count of completed bills for the current day.
Pending customer credit	Sum of customer balances currently outstanding.
Inventory value	Available product stock multiplied by purchase rate.
Low stock products	Products at or below their reorder level.
Commission pending	Plumber commission earned minus commission paid.

Sales overview chart

- Use Daily, Weekly, or Monthly to change the selected view label and operating perspective.
- The bars compare Sales and Purchase activity. Hovering a bar shows its formatted amount.
- The chart is a quick signal; use Billing, Purchase, or reports in the table screens for record-level detail.

Quick actions

Action	Opens	Use it when
New bill	Billing	A customer is waiting at the counter.
New purchase	Purchase	A supplier invoice and incoming stock arrive.
New product	Inventory	A new SKU or product variant needs to be added.
New customer	Customers	You need a new customer account or credit profile.
New plumber	Plumbers	A referral partner needs to be registered.
View deposit ledger	Patsanstha	You need to record or follow up a daily deposit.

Recent bills and inventory alerts

Recent bills shows the latest completed sales with invoice number, customer, amount, and payment status. Inventory alerts lists the first low-stock products with variant, available quantity, and a Reorder badge. Use View all or View inventory to open the full records.

3. Navigation and global controls

The same application shell surrounds every screen. Learning these controls makes every module faster.

Sidebar navigation

Group	Options	Purpose
Workspace	Dashboard	Daily business summary
Operations	Purchase, Inventory, Billing	Buy stock, maintain catalogue, sell products
Relationships	Customers, Plumbers	Customer credit and referral partner accounts
People	Workers, Attendance	Team records, daily presence, and payroll
Finance	Patsanstha Pegni	Daily deposit commitment and ledger
System	Settings	Business, billing, inventory, commission, deposit, worker, and role preferences
Bottom	Notifications	Unread reminders and operational alerts

Top bar controls

- Breadcrumb: shows Vinay Traders and the current screen name.
- Search anything: opens a command palette. It searches products, customers, and invoices. Press Enter to open the first result and Esc to close.
- Notifications bell: opens a small unread notification panel. Selecting an alert marks it read and opens its target screen.
- Quick add: opens New bill, New purchase, New product, New customer, New plumber, and Deposit entry.
- Profile button: shows the current administrator label and a shortcut to Settings.
- Collapse sidebar: reduces the left navigation for more working space. Expand restores it.

Mobile view

On a narrow screen the sidebar is replaced by a bottom navigation bar with Home, Billing, Inventory, Customers, and More. Tables switch to stacked record cards. Billing becomes a five-step flow: Customer, Reference, Products, Review, Payment. The same data and save actions are used on desktop and mobile.

> Keyboard shortcuts: Ctrl+K or Cmd+K opens global search. In Billing, F2 starts a new bill, F4 focuses product search, Ctrl+S opens checkout, and Esc closes a dialog.

4. Daily operating workflow

Use this sequence for a normal shop day. The modules can be used independently, but this order keeps stock, balances, and payments aligned.

Step	What to do
1. Open	Open Dashboard. Review low stock, pending customer credit, supplier purchase activity, and commission pending.
2. Receive stock	Open Purchase, select New purchase, select the supplier, add products and quantities, enter paid amount, then Save & print when the invoice is complete.
3. Serve a customer	Open Billing. Select an existing customer or enter walk-in details, optionally select the plumber reference, add products, review GST and totals, then collect payment.
4. Record credit	In the payment dialog select Credit or enter a partial amount. The unpaid amount is added to the customer credit ledger.
5. Check stock	Open Inventory for catalogue and stock status. Use Stock ledger for an audit trail or Adjust stock for a count correction, damage, or opening quantity.
6. Update people	Use Customers and Plumbers for account records and payouts. Use Workers and Attendance for team records and daily presence.
7. Close the day	Review Notifications and Patsanstha. Record deposits, follow up pending credit, and confirm there are no unresolved low-stock or payment alerts.

When an action is saved, the application updates the local view immediately and synchronizes the workspace data to Supabase when the environment is configured.

5. Billing and point of sale

Billing is the main counter workflow. It creates a sale invoice, calculates GST, optionally tracks a plumber referral, records payment, and updates inventory.

Start a bill

Step	Options and meaning
Customer	Choose an active customer or Walk-in customer. For a walk-in, Name, Mobile, and Address are optional.
Reference	Choose No reference / direct sale or an active plumber. The selected rate and estimated commission are shown.
Products	Search by product name, size, SKU, or barcode. F4 focuses the search. Category chips narrow the result list.
Bill items	Edit quantity, rate, discount percentage, and remove a line. GST comes from the product settings. Add a delivery note if needed.
Review	Review subtotal, discount, taxable amount, CGST/SGST or IGST, round-off, and grand total. Tick Interstate sale (IGST) for an interstate invoice.
Payment	Choose Cash, UPI, Card, Bank, Credit, or Mixed. Enter amount received, reference number, note, or cash/UPI/bank split.

Payment choices

- Cash: enter amount received. If it is greater than the bill, the dialog shows change to return.
- UPI, Card, or Bank: enter amount and an optional transaction/reference number.
- Credit: records no immediate payment and puts the unpaid amount on the customer balance.
- Mixed: split the received amount across Cash, UPI, and Bank. The payment summary shows received and remaining due.
- Partial payment: enter less than the total. The remaining amount becomes customer credit.

Other Billing options

- Hold bill: temporarily stores the current bill so the counter can serve another customer. Open Held bills, then Resume or Remove.
- Save draft: stores an unfinished invoice without completing the sale. Open Recent bills and choose Resume on a draft.
- Recent bills: search invoices, open a completed invoice, or resume a draft.
- Bill complete: after a successful sale, use Print / PDF, View invoice, or New bill.
- Invoice page: use Print / Save PDF. The printed invoice includes business details, customer, line items, HSN, GST, totals, payment, notes, and authorisation footer.

> Do not manually edit stock after a normal sale. A completed invoice consumes stock and writes a Sale movement automatically. Use Adjust stock only for a physical count correction, damage, transfer, or opening balance.

6. Purchases

Purchases record supplier invoices and incoming stock. A completed purchase increases inventory and updates supplier due amounts.

New purchase form

Field or control	How to use it
Supplier	Select the supplier account. Supplier balance and purchase history are connected to this record.
Supplier invoice	Enter the supplier's invoice number for matching and search.
Invoice date and due date	Record the supplier document date and the date payment is expected.
Product lines	Choose a product, enter quantity, unit, purchase rate, discount, and GST. Remove extra lines when needed.
Conversion factor	Use when the purchase unit differs from the product sales unit, such as a box converted to pieces.
Paid amount	Enter money paid at purchase time. The remainder becomes supplier due.
Invoice attachment	Choose a local image or PDF filename as a reference to the supplier document.
Save draft	Keep an incomplete supplier invoice without posting it as a completed purchase.
Save & print	Complete the purchase and open the print flow.

Purchase register and detail

The Purchase screen shows today's purchase, monthly purchase, supplier balance, and items purchased. The register can be searched by purchase number, supplier, or supplier invoice. Select a row to open the detail screen, which shows supplier details, due date, payment status, totals, and every purchased line.

7. Inventory

Inventory is the product catalogue and the source used by Billing and Purchase product search.

Inventory dashboard

Control	What it does
Products card	Shows total products and active variants.
Inventory value	Shows stock value at purchase rate.
Low stock	Counts products above zero but at or below reorder level.
Out of stock	Counts products at zero or below.
Inventory filter	All products, Low stock, Out of stock, or a product category.
Add product	Opens the product editor.
Stock ledger	Opens the movement audit trail.
Price matrix	Opens the bulk rate editor.

Product editor fields

A product stores name, brand, category, subcategory, product family, SKU, barcode, HSN, GST, size, variant, purchase unit, sales unit, base unit, conversion factor, purchase rate, selling rate, MRP, minimum selling price, stock, reserved quantity, reorder level, minimum stock, rack, shelf, warehouse, supplier, images, and notes. Keep SKU, HSN, units, rates, and reorder values accurate because downstream invoices and stock warnings use them.

Product detail screen

- Adjust stock: enter a positive or negative quantity and a reason. The change is written to the stock ledger.
- Edit product: change catalogue and pricing fields.
- Product details: review brand, category, SKU/barcode, variant, location, and supplier.
- Latest stock movement: review the newest entries or open the full Stock ledger.

Stock ledger

Every row has date/time, product, transaction type, reference, stock in, stock out, balance, unit, location, user, and notes. Transaction types include Opening, Purchase, Sale, Sale Return, Purchase Return, Adjustment, Damage, Transfer, and Correction.

Price matrix

Switch between Selling rates and Purchase rates. Edit the visible product rate fields, search or sort the table as needed, and select Save changes. Use this for controlled bulk changes rather than editing every product one at a time.

8. Customers

Customers is the account directory for retail, business, contractor, and walk-in relationships. It tracks purchases, bills, credit limits, and payments.

Customer directory controls

Control	Options
Customer type	All customers, Regular, Walk-in, Business, Contractor.
Balance filter	All balances, Outstanding, Settled.
Search	Name, mobile, area, or GSTIN.
Export	Downloads the visible customer records as CSV.
Add customer	Opens the customer form.

Add or edit customer

Enter customer name, mobile, alternate mobile, type, area/city, GSTIN, billing address, delivery address, opening balance, credit limit, credit period, plumber reference, status, and notes. The account balance is recalculated from the existing balance and opening balance when editing.

Customer account options

- Edit customer: update the profile fields.
- Receive payment: record Cash, UPI, Bank, or Card payment against the outstanding balance. Add a reference and note if required.
- Create bill: opens Billing with the customer already selected.
- Overview: contact, business details, credit limit, available credit, opening balance, last purchase, and account notes.
- Bills: all completed invoices for the customer; select one to open the invoice.
- Payments: all account payments received outside or after an invoice.
- Credit ledger: chronological debit/credit statement with export.
- Returns: reserved area for linked returns. References: shows the assigned plumber or offers Edit reference. Activity: chronological account activity.

9. Plumbers and referral commissions

Plumbers are referral partners. Selecting a plumber on a bill makes referral sales and commission visible on the partner account.

Partner directory controls

Control	Options
Filter	All plumbers, Active, Inactive, Commission pending.
Search	Name, mobile, or area.
Export	Downloads name, mobile, area, rate, sales, and pending commission as CSV.
Add plumber	Creates a new partner record.

Add or edit plumber

Enter full name, mobile, alternate mobile, area, joining date, commission percentage, address, bank details, UPI ID, status, and notes. The default commission comes from Settings.

Plumber profile tabs and actions

- Edit profile: update partner details and notes.
- Pay commission: record a Cash, UPI, Bank, or Card commission payment up to the pending amount.
- Overview: contact details, joining date, commission basis, referred customers, payout details, and notes.
- Customers: customers linked directly or through referred invoices.
- Bills: completed invoices linked to the plumber.
- Commission ledger: bill value, eligible value, rate, earned commission, paid amount, and pending amount; export is available.
- Payments: partner payout history. Notes: view or edit partner notes.

> Commission basis is controlled in Settings. The current configuration can calculate before GST or on the final invoice total, and the bill shows the estimated commission before checkout.

10. Workers, attendance and payroll

The People section connects worker profiles, attendance marks, monthly payroll, and salary payments.

Workers screen

- Summary cards show total workers, present today, monthly payroll, and pending salary.
- Add worker requires name, role, and monthly salary. The created profile starts Active.
- Review opens present days, net salary, paid amount, balance, and Mark salary paid.
- Payroll opens the current month register. Each row shows present, absent, paid days, net salary, balance, and Pending/Paid status.

Worker profile

A worker profile has Overview, Attendance, Salary, Payments, and Activity tabs. Use Salary slip to print the current payroll summary and Mark paid to record the current balance through bank payment.

Daily Attendance

Choose a date, then set each worker to Present, Absent, Half Day, or Paid Leave. Present automatically uses 09:00 to 18:00 in the quick marking flow. The row badge shows the saved status.

Monthly Attendance

- Choose a month and use Mark all present for the full worker matrix when appropriate.
- Click a day cell to cycle Pending -> Present -> Half Day -> Absent -> Paid Leave -> Present.
- The summary shows calendar days, workers, present marks, and leave/absent marks.

Payroll calculation

Payroll uses salary type, working days, attendance status, overtime, bonus, advance, deduction, and recorded payments. Net salary minus payments becomes the balance available for payout.

11. Patsanstha deposit ledger

The Finance menu item is labelled Patsanstha Pegni in the application. It tracks the shop's daily deposit commitment.

Area	Meaning
Daily amount	Expected amount from Settings.
Paid this month	Sum of saved deposit payments.
Pending	Expected minus paid, never below zero.
Missed days	Entries with Skipped status.
Deposit ledger	Date, expected, paid, difference, status, and method.
Add deposit	Enter date, amount paid, and notes. The form assigns Paid, Partial, or Skipped from the amount.

Use Add deposit at the time money is deposited. If a day is missed, record zero or a partial amount and use Notifications or the dashboard pending amount for follow-up.

12. Settings and notifications

Settings controls the defaults used by new transactions. The Save changes button writes editable values to the connected workspace.

Settings section	Editable or visible options
Business profile	Business name is editable. Owner, address, and GSTIN are shown from the current business profile.
Billing & GST	Default GST percentage and invoice prefix. Available GST choices are 0, 5, 12, 18, and 28.
Inventory	Explains that negative inventory is disabled and stock corrections should use Stock ledger.
Commission	Default plumber commission percentage and calculation basis: Before GST or Final invoice.
Deposits	Daily deposit amount and missed-entry reminder display.
Workers	Explains that worker profiles, attendance, and payroll live in People.
Roles	Displays Admin, Billing staff, Purchase staff, Inventory staff, and Accountant with View/Create/Edit labels.

Notifications

Notifications are actionable reminders. Each row shows severity, title, description, date, and type. Use Mark read on one entry or Mark all read at the top. The sidebar count and top-bar dot show unread items.

13. Tables, search, export and mobile view

Most list screens use the same table control set. Once learned, it works in Inventory, Purchases, Customers, Plumbers, Workers, Payroll, invoices, payments, and ledgers.

Control	How it works
Search records	Filters visible rows using the screen's configured search fields.
Select checkbox	Select one or all visible rows. Selected records are used by Export.
Column heading	Click to sort ascending or descending.
Export	Downloads CSV. If rows are selected, only selected records are exported; otherwise all filtered rows are exported.
Display settings	Show or hide columns and turn on Compact rows.
Row link	Click the first column when the screen supports a detail page.
Actions	A row-specific action such as Review, Resume, Mark paid, or View profile.
Pagination	Shows the current range and uses previous/next page buttons. Default page size is eight rows.
Empty state	If no row matches, clear the search or change the filter.

CSV exports are generated in the browser and are intended for local reporting. The full connected data remains in Supabase when the environment variables are present.

Mobile tips

- Use More in the bottom navigation to reach less frequent modules through Quick add.
- Tables become record cards; open the first field to view detail when a row is clickable.
- Billing's step buttons let you jump between Customer, Reference, Products, Review, and Payment.
- The same Save, Print, Export, and payment rules apply on mobile; only the layout changes.

14. Data, cloud connection and operating safeguards

The browser frontend is connected to Supabase for workspace data and deployed through Cloudflare Workers static assets.

Connection flow

User action	Frontend state	Supabase	Cloudflare
Create bill, purchase, payment, or edit	React screen runs validation and updates AppData	vt_app_state stores authoritative JSON; vt_* tables receive normalized projections	Serves the web application assets
Reload or open another device	useData reads remote state when configured	Returns the current workspace state	Routes SPA paths to the frontend

Database areas

The Supabase migrations create namespaced tables for products, inventory batches, suppliers, customers, plumbers, workers, attendance, invoices, invoice items, purchases, purchase items, payments, payment splits, deposits, stock transactions, price history, settings, role permissions, notifications, and the aggregate vt_app_state record.

Current security status

> The current frontend has no sign-in screen, so the deployed workspace uses open anonymous policies for the application tables. Before public multi-user use, add Supabase Auth and replace these policies with authenticated, tenant-scoped and branch-scoped access. Never put a service-role key in a Vite frontend.

Data safety habits

- Use a unique SKU and correct unit for every product before selling it.
- Complete a purchase only after checking supplier invoice number, rates, quantities, and paid amount.
- Use Stock ledger for corrections so there is an audit reference.
- Use customer credit limits and balances before accepting another credit sale.
- Record payment references for UPI, Card, Bank, and commission settlements.
- Keep the Supabase publishable key in VITE_SUPABASE_PUBLISHABLE_KEY only; do not commit private keys.

15. Troubleshooting and quick reference

If the software does not behave as expected, check these common cases first.

Symptom	What to check
The app opens but data is empty	Confirm .env.local has VITE_SUPABASE_URL and VITE_SUPABASE_PUBLISHABLE_KEY, then reload. Without them, the app uses local fallback data.
A product cannot be added to a bill	Check stock minus reserved quantity, product status, and whether negative inventory is disabled.
A payment will not save	Check that the paid amount is non-negative. Mixed payment amounts must be entered in Cash, UPI, or Bank.
A customer still has a balance	The unpaid part of a credit or partial invoice remains on the credit ledger. Record a Receive payment entry.
A draft is missing from the checkout	Open Billing > Recent bills and search by invoice or customer. Drafts can be resumed there.
Stock value looks wrong	Review purchase rate, conversion factor, reserved quantity, and the Stock ledger movements.
A table appears blank	Clear the table search, reset its filter, or check the Empty state message.
The page is not found after a refresh	Use the deployed SPA URL or the Vite dev server. Cloudflare is configured for single-page application fallback.
Cloud data is not updating	Check browser network access and Supabase project availability. The frontend logs a Supabase save failure in the browser console.

Local run commands

Use these commands in Visual Studio Code's PowerShell terminal:

```
cd D:\vinay-traders\vinay-traders
npm install
npm run dev
```

Then open http://localhost:5173. To apply linked Supabase migrations use npx supabase db push --linked. To build and deploy the Cloudflare frontend use npm run build followed by npx wrangler deploy.

Support checklist

- Capture the route, record ID, and exact action that failed.
- Check whether the row is local fallback data or remote Supabase data.
- Check Notifications for low stock, credit, or missed deposit reminders.
- Use the Stock ledger, customer credit ledger, commission ledger, or payment history to trace financial differences.

> The safest operating pattern is: enter source documents carefully, complete the transaction once, and use the relevant ledger for corrections and follow-up.
